

## *Typst Tryout*

Recently I've tried to use typst for the technical writing and I also tried to use typst-preview plugin on neovim to integrate it into my workflow. It surprises me even more that without any tweak, the infrastructure for using typst with neovim is as mature as the old, stable latex tool like vimtex.

It has very nice syntax that is more compact than the obscure Latex. Also a huge plus is the math syntax like `sum_(i in NN) 1 + i` for rendering  $\sum_{i \in \mathbb{N}} 1 + i$ . This would make my math related writing even more enjoyable.

I must admit that this is such a good type-setting system that is clean, easy to write and have modern and great infrastructure for the whole pipeline.

In order to make use of it more often, I'm also considering how I can enable using this on the blogging and that is why you can see this pdf.
